there was the first round of samples collected Dec. 21st which had 7 high results (4 were several magnitudes higher than the risk levels). Before disclosing those results the school re-tested on Jan. 16th and the 7 high samples were non-detect.

The school couldn't offer us a reasonable explanation for the 7 high samples on Dec. 21st other than to say it had to be some cross contamination. We (EPA) can't substantiate the cross contamination claim and so we asked for a third round of samples, collected by a different company, with split samples going to an EPA lab.

The new contractor is scheduled to collect those samples this Monday, March 6 and the school asked for a 24 hour lab turn around time so we should have the results by this time next week.

I thought there were follow-up tests. Apparently those tests don't have any weight with the local health department. How soon will the third party consulting business be engaged on round three of the sampling?

As we suspected, the health department is shutting down the rooms with high air levels until the re-test proves the levels are safe.
